Description: This article is by Kendra Curtis, who is Ex-Gogler with 20+ years of Software Engineering Experience. It talks about processes and best practices of code review followed in every developer's life. In a working system where 1 feature or new system involves multiple developers collaborating, code review has become an essential process or step before merging any feature to minimize faults/failures, optimize solutions, and check the correctness of business logic. The concept of raising Pull Request(PR) is the step where code review happens before the code is integrated with the main branch. Based on the review comments, further code changes are done which prevents major faults and failure, and does save time and cost to the company. The level of code review may vary depending on the feature, organization policy, and severity/priority of change.

Recommendation: I highly recommend this article. As code review stage is something every software engineer will go through and needs to understand the best practices and thinking behind code/peer review from the standpoint of the reviewer as well as the developer.
